

ABSTRACT

A navigation apparatus (100) includes guiding units such as a voice output unit (111) that outputs guidance voice, and a vibrator (113) that notifies guidance contents by vibration. When a route searched
5 result where a plurality of transportation means are used from a departure place to a destination is acquired, namely, when a route including four sections such as a walk section, a train section, a bus section, and a walk section is acquired, a guidance controller 120 accepts an instruction for guidance only for the walk sections. When
10 the instruction is issued, the guidance controller 120 makes a control so that the guidance is provided only for the walk sections, whereas the guidance is not provided for the train section and the bus section.
